China's Daily Output of Coal Rebounds to Over 12 Million Tonnes

Source : channelnewsasia.com

Highlights

China's coal output returned to more than 12 million tonnes per day as of Feb 20, the country's state planner said on Monday, a level equal to the average daily production of the fourth quarter of last year.

Daily coal output in January and early February was affected by the Chinese New Year holiday. The National Development and Reform Commission (NRDC) did not give a figure for January output.

Production and supply of coal in China's main production areas of Shanxi, Shaanxi and Inner Mongolia are expected to stabilise as the weather warms up, the NDRC said in its official Wechat account.

Authorities have ordered coal miners to run at maximum capacity to tame red-hot coal prices and prevent a recurrence of September's nationwide power crunch that disrupted industrial operations and added to factory gate inflation.

Colombia Mining Production, Exports Rose in 2021 - Industry Group

Source : miningweekly.com

Highlights

Colombia's mining production and exports rose in 2021 from the previous year, the Colombian Mining Association (ACM) said on Friday, while forecasting mineral output will increase by 10% this year.

The Andean country's coal production rose to 59.6-million tonnes in 2021, up from 49.3-million tonnes the prior year, the ACM said, based on information taken from various government sources, including the DANE statistics agency and the National Mining Agency (ANM).

Total mining exports rose 22% to \$13.4-billion, the ACM said.

Colombia's output of coal - an important source of income for the government - is expected to increase by around 7-million tonnes in 2022, ACM president Juan Camilo Narino said during a press conference.

The South American country's coal production fell some 40% in 2020 amid the impact of the coronavirus pandemic and a 91-day strike at major mine Cerrejon.

Gold production rose to 2.5-million troy ounces in 2021, the ACM said, up from 1.5-million troy ounces in 2020. A troy ounce weighs 31.10 g, while a regular ounce weighs 28.35 g. Narino lamented Colombia's low copper production. According to the ACM, production in 2021 hit 12 000 t, up from 9 300 t in 2020.

Last year, Colombia's environmental licensing authority shelved a request from South African-listed miner AngloGold Ashanti for the Quebradona copper mine, leading the company to say the project would face delays.

Government figures for 2021 mining production are expected later this month.

Australia Forecasts Longer La Nina Wet Weather Period

Source : argusmedia.com

Highlight

Australia's Bureau of Meteorology (BoM) forecasts the La Nina weather pattern bringing wetter weather to north and east Australia will extend through April, increasing the potential for disruptions to the coal, iron ore and LNG sectors.

A wetter than normal wet season, which runs from November to April, in Queensland, New South Wales (NSW) and Western Australia (WA) could lead to further flooding that may disrupt coal mining and rail transport, as well as onshore gas production.

Heavy rain in NSW and Queensland in November caused localised flooding in the coal fields in the Hunter and Gunnedah basins, as well as near the ports of Gladstone, Hay Point and Dalrymple Bay. This heavy rain and storms associated with ex-tropical cyclone Seth have prompted Australian rail firm Aurizon to cut its coal haulage guidance to 202mn t from 212mn t for the 2021-22 year to 30 June.

A La Nina pattern is often associated with a longer and more disruptive cyclone season, particularly in Queensland.

Queensland's coal ports of Abbot Point, Dalrymple Bay and Hay Point, as well as the coal and LNG port of Gladstone, are all within the cyclone-prone region. Each of these ports have had to close and order vessels out to sea in previous years because of cyclones. The state's rail network is also prone to damage and disruption by cyclones and flooding.

Elevated cyclone activity in northern WA could disrupt exports the nation's major iron ore export hubs and significant LNG and petroleum export facilities. Cyclone Veronica, which hit the WA coast in March 2019, reduced iron ore shipments for a couple of months and forced most major producers to cut their production guidance.

France Coal-fired Power Plants Get Short-term Right to Burn More

Source : mining.com

Highlights

France is temporarily allowing electricity producers to burn more coal after the nation's grid operator warned of possible power shortages.

The government formally raised the cap on running coal-fired power stations for the months of January and February, according to a decree published Sunday in the official journal. The Ecology Ministry proposed the loosening in early January, saying it was necessary to ensure a secure supply of electricity when power use is high during the cold winter months.

Coal is playing a bigger role in Europe's energy mix during the winter even as prices rise and climate concerns pressure governments to curb its use.

France's coal units will be allowed to operate for about 1,000 hours over the first two months of 2022, 300 hours more than the cap that was set in 2019 to help curb carbon emissions.

The grid operator, Reseau de Transport d'Electricite, said in December that France ran the risk of a power shortfall in the event of a cold snap and insufficient wind energy. An unusually high number of nuclear reactors have been halted for maintenance.

India : Govt Plans New Tech, Digital Infrastructure to Support Domestic Coal Mines Operations

Source : [financialexpress.com](https://www.financialexpress.com)

Highlights

The government plans to implement new technologies and build digital infrastructure to support current and future coal mines operations, a move that would reduce the country's dependency on imports. Technological advancements in coal mining are also making operations more productive.

New technologies can have a number of impacts on mining operations, including safety and productivity, environmental protection, and opportunities for women. Safer working conditions through improved underground communication, automation, more sophisticated mineral and metal transportation, and emergency response measures are achieved by integrating technology into mining projects, it said.

A new way of thinking will be inculcated in the entire organisation. A technology transformation team will be set in place to drive impact and sustain the programme at an established centre of excellence. A robust tracking and change management

mechanism will be deployed to ensure timely resolution and delivery.

India had a total coal reserve of 344.02 billion tonnes. Commercial primary energy consumption in India has seen a rise of 700 per cent in the past four decades. Major factors for the increase in demand for energy are expanding economy, rising population and the improvement of quality of life. The limited potentiality of other energy sources will lead to the continuation of coal as the primary resource in India's energy scenario for the next few decades

However, due to the high demand and poor average quality, the country has to import coal of higher quality mainly to meet the requirements of its steel plants, cement plants and sponge iron plants, among others.
